EN VISION – THE FUTURE OF VIRTUAL LIVING

A Project Report

Submitted for the partial fulfilment of the requirements for the degree of

MASTER OF COMPUTER APPLICATIONS

UNIVERSITY OF MADRAS

By

SIMAN JOHN R

(812400091)

Under the Guidance of

Mrs. A.AKILA, M.Sc., MCA, M.Phil.,

ASAN MEMORIAL COLLEGE OF ARTS & SCIENCE

JALADAMPET, CHENNAI - 600 100

APRIL -2026

BONAFIDE CERTIFICATE

This is to certify that the project report titled **“ EN VISION-THE FUTURE OF VIRTUAL LIVING ”** is a bonafide record of work carried out by **Mr. SIMAN JOHN R** RegNo. **812400091** during the final semester from Nov 2024 to April 2025, under my guidance, in partial fulfilment of the requirements for the degree of **MASTER OF COMPUTER APPLICATIONS** by **UNIVERSITY OF MADRAS**.

Date:

Mrs. A.AKILA, M.Sc., MCA, M.Phil.,

Project Guide

Dr. S. Jawahar, MCA, M.Phil, Ph.D.

Head of the Dept

Dr. T.S. Santhi, MBA, M.Com, M.Phil, B.Ed., Ph.D.

Principal

Submitted for the viva-voce examination on_____

Examiners:

1.

2.

DECLARATION

I, **SIMAN JOHN R** hereby declare that this project report titled **" EN VISION- THE FUTURE OF VIRTUAL LIVING "** submitted in partial fulfilment of the requirement for the Degree of **MASTER OF COMPUTER APPLICATIONS**, **UNIVERSITY OF MADRAS** is my original work and it has not formed the basis for the award of any other degree.

(Signature of the Student)

SIMAN JOHN R

Place:

Date:

cambtech

COMPLETION CERTIFICATE

This is to certify that **SIMAN JOHN R,** Reg. No. **812400091**, a student of Master of Computer Applications at **Asan Memorial College of Arts and Science, Chennai – 600100,** has successfully completed the project titled **"EN VISION - THE FUTURE OF VIRTUAL LIVING"** as part of the curriculum requirement for the final year.

The project was carried out during the period from **12th December 2025 to 13th April 2026.** During this time, the student worked well and showed interest, dedication, punctuality and a good attitude towards the work.

We extend our best wishes for his future success.

S. Gowri Shankar

ACKNOWLEDGEMENT

I express my gratitude to the creator, who created and nurture me in this transitory world. I also express my gratitude to him for giving me an opportunity to successfully complete my IV semester final project as a partial requirement of the **MCA** program.

I express my deepest gratitude to our honourable Principal, **Dr.T. S. SANTHI, MBA, M.Com, M.Phil, B.Ed., Ph.D.,** for her valuable support and guiding authority on all aspects.

I am grateful to our honourable Head of the Department **Dr. S. Jawahar, MCA, M.Phil, Ph.D.,** for guiding me throughout my project.

I acknowledge my sincere gratitude to my honourable guide **Mrs. A. Akila, M.Sc., MCA, M.Phil., Assistant Professor,** whose kind and proper guidance made it possible to prepare this report. I am indebted to her, for her excellent supervision and guidance who has given me a chance to prepare my final project **" EN VISION-THE FUTURE OF VIRTUAL LIVING ".**

Finally, I would like to express my gratitude to all the people who helped me by providing their valuable assistance and time during this final project preparation.

Yours truly,

SIMAN JOHN R

812400091

ABSTRACT

This project, titled **"EN VISION – THE FUTURE OF VIRTUAL LIVING,"** presents the design and development of an advanced Virtual Try feature integrated into an e-commerce platform to enhance online shopping through Augmented Reality (AR). The system enables users to visualize selected products within real-world environments before making a purchase, offering an interactive and immersive experience that closely replicates physical shopping. The prototype supports multiple products and provides real-time visualization, 3D rotation, and basic customization features to assist users in making informed decisions.

The application is developed using Unity and C# for AR-based product visualization, while the web interface is built using HTML, CSS, and JavaScript to ensure a responsive and user-friendly experience. The system integrates AR/3D components with REST-style backend services to efficiently manage product data and user interactions. Version control using Git is implemented to handle development iterations and ensure smooth collaboration.

The proposed system aims to bridge the gap between digital product representation and real-world experience, thereby improving customer engagement, increasing purchase confidence, and reducing product return rates. By combining immersive technology with modern web development practices, the project demonstrates how traditional e-commerce platforms can be transformed into intelligent and interactive environments.

Furthermore, the system is designed with scalability and future enhancement in mind, allowing integration of advanced features such as AI-driven recommendations, enhanced 3D modeling, and cross-platform compatibility. The approach can be extended to multiple domains including furniture, fashion, and interior design. This project highlights the potential of Augmented Reality in redefining digital interaction and represents a forward-looking solution aligned with the future of virtual living.

CHAPTER 1

INTRODUCTION

1.1 COMPANY PROFILE:

Cambtech is an e-learning startup with the goal to train abiding engineering graduates on advanced concepts in streams of engineering. With Cambtech, receive training from the best professionals in the field of engineering which will help to boost your career. They provide you with a platform that will help us to explore and learn from the best thereby ensuring the lift for that dream career. Here at Cambtech, they aim to provide valuable insights to our students for their growth and development. We offer you an interactive platform, which will help you to learn and prepare yourself for the job recruitment process.

Their expertise spans across different domains, including technology, engineering, finance, healthcare, and more, ensuring that we are well-equipped to handle diverse recruitment needs.

SERVICES PROVIDED:

1. **Permanent Staffing:**
   They provide permanent staffing solutions that ensure businesses have access to highly skilled professionals who fit their long-term organizational goals.
2. **Temporary and Contract Staffing:**
   CambTech offers flexible staffing options, including temporary and contract placements, tailored to meet specific project needs or seasonal demands.
3. **Executive Search:**
   The executive search service helps clients find senior leadership and management professionals with the expertise needed to drive their business forward.
4. **Campus Recruitment:**
   They assist companies in finding the best fresh talent from campuses, organizing campus recruitment drives and internship programs to build strong talent pipelines.

1.2 ABOUT THE PROJECT

The rapid growth of e-commerce has transformed the way consumers purchase products, especially in domains such as furniture and home décor. However, one of the major limitations of traditional online shopping platforms is the inability of customers to physically visualize products in their real environment before making a purchase. This limitation often leads to uncertainty, dissatisfaction, and high product return rates. To address this challenge, the present project introduces an innovative solution titled **Augmented Reality Based Virtual Try-On E-Commerce Platform.**

This project aims to enhance the online shopping experience by integrating **Augmented Reality (AR)** technology into an e-commerce platform. The system allows users to virtually place and visualize furniture items within their own living space using a device camera. By providing a real-time, interactive preview of products, the platform enables customers to make informed purchasing decisions, thereby improving satisfaction and reducing returns.

The developed system, branded as **En'Decore — Maison of Furniture**, focuses on delivering a premium and immersive shopping experience. The platform is designed using modern web technologies including **HTML5, CSS3, and Vanilla JavaScript**, ensuring a lightweight and high-performance frontend. For backend services, **Google Firebase** is utilized, providing real-time database management, user authentication, and secure data handling without the need for traditional server infrastructure.

A key highlight of the project is the integration of **AR.js**, a web-based augmented reality framework that enables camera-based visualization directly within the browser. This eliminates the need for users to install additional applications, making the feature highly accessible and user-friendly. Customers can simply click on the "View in AR" option to see how a furniture item fits within their physical environment.

The platform offers a complete set of e-commerce functionalities, including user registration and login, dynamic product catalog, category filtering, product detail pages, shopping cart management, and order processing. The shopping cart is designed to update in real-time, displaying subtotal, tax (GST), and total cost dynamically. User data, cart items, and orders are securely stored in **Firebase Firestore**, ensuring efficient data management and scalability.

Another important aspect of the project is its **luxury-oriented user interface design**. The platform adopts a premium aesthetic with elegant typography, gold-accented color schemes,and smooth animations. This design approach enhances user engagement and aligns with high-end branding standards, making the shopping experience visually appealing and intuitive.

The system is developed with a **responsive design**, ensuring compatibility across various devices such as desktops, tablets, and smartphones. This cross-platform accessibility allows users to interact with the platform seamlessly regardless of their device. Additionally, the application is optimized for performance, with fast loading times and efficient rendering techniques.

From a technical perspective, the project demonstrates the effective use of **client-side architecture combined with cloud-based backend services**. The use of Firebase eliminates the need for server maintenance, reduces development complexity, and provides built-in security features. The application logic is handled through JavaScript, which interacts with Firebase services to perform operations such as authentication, database updates, and order processing.

The implementation of this system addresses several real-world problems associated with online shopping. It minimizes the gap between physical and digital retail by providing an immersive visualization experience. Customers can evaluate the size, design, and placement of furniture before purchasing, which significantly reduces uncertainty and enhances confidence.

Furthermore, the project highlights the potential of integrating emerging technologies like **Augmented Reality** into everyday applications. It demonstrates how AR can be leveraged not only for entertainment but also for practical, commercial use cases in the e-commerce industry.

In conclusion, the **Virtual Try-On E-Commerce Platform** represents a modern, scalable, and user-centric solution that improves the overall online shopping experience. By combining AR technology with robust web development practices, the system provides a unique and effective approach to digital retail, making it highly relevant in today’s technology-driven market.

CHAPTER 2
REQUIREMENT SPECIFICATION

2. REQUIREMENT SPECIFICATION

The Requirement Specification phase defines the hardware and software needed to develop the proposed system. It outlines the necessary tools, technologies, and system configurations for implementation. This includes hardware components like processor, memory, camera, and display. It also covers software requirements such as operating systems, browsers, frontend technologies, and backend services. Proper specification ensures system compatibility, performance, and smooth user experience.

2.1 HARDWARE SPECIFICATION

PROCESSOR	Any modern mobile or desktop processor (Intel i3 / ARM equivalent or higher)
RAM	2 GB minimum (4 GB or more recommended)
HARD DISK / STORAGE	2 GB or more of free space
CAMERA	Required for AR feature (built-in webcam or mobile camera)
DISPLAY	Minimum 1024×768 resolution
INTERNET	Active internet connection (for Firebase services and AR.js)
GRAPHICS	Integrated GPU or higher (for smooth AR rendering)
BATTERY	Minimum 3000 MAH (for mobile devices using AR features)
SENSORS	Gyroscope and Accelerometer (for better AR experience)

2.2 SOFTWARE SPECIFICATION

OPERATING SYSTEM	Windows 10/11, macOS, Linux, Android, iOS
WEB BROWSER	Google Chrome (recommended), Safari, Microsoft Edge
CODE EDITOR	Visual Studio Code / Any text editor
FRONTEND TECHNOLGIES	HTML5, CSS3, JavaScript (ES6+)
BACKEND / DATABASE	Google Firebase (Firestore, Authentication)
AR FRAMEWORK	AR.js (web-based augmented reality)

2.3 ABOUT THE SOFTWARE

2.3.1 HTML5

HTML5 (Hyper Text Markup Language version 5) is the standard markup language used for structuring content on the web. In En 'Decore, HTML5 provides semantic elements for the page structure, forms for user input (login, registration, contact, checkout), and the foundational layout for all pages.

2.3.2 CSS3

CSS3 (Cascading Style Sheets Level 3) is used for styling and visual presentation. The project uses a comprehensive custom design system with CSS custom properties (variables), Grid and Flexbox layouts, animations and transitions, glassmorphism effects, and responsive media queries. A luxury design palette featuring ivory, gold, charcoal, and cream tones is implemented entirely in vanilla CSS.

2.3.3 JavaScript (Vanilla ES6+)

JavaScript powers all client-side interactivity including dynamic product rendering, eventdriven cart management, Firebase SDK interactions for authentication and database operations, AR modal controls, toast notifications, and DOM manipulation. No external JavaScript frameworks or libraries are used — the application relies on pure vanilla JS for maximum performance.

2.3.4 Google Firebase

Firebase is a Backend-as-a-Service (BaaS) platform by Google that provides: **Firebase Authentication** for email/password-based user registration and login; **Cloud Firestore** as a NoSQL real-time database for storing user profiles, shopping carts, orders, and contact form messages. Firebase SDK v9 (compat mode) is used for client-side integration.

2.3.5 AR.js

AR.js is an open-source, lightweight JavaScript library for web-based Augmented Reality. It enables marker-based and markerless AR experiences directly in the browser without requiring native app installation. In En 'Decore, AR.js is used to project furniture 3D models into the user's camera feed for virtual try-on.

CHAPTER 3

SYSTEM ANALYSIS

SYSTEM ANALYSIS

System analysis is a crucial phase in the system development life cycle that focuses on understanding the problem, identifying user requirements, and proposing suitable solutions. It involves detailed study and interaction between the system developers and end users to ensure that the developed system meets real-world needs. In this project, the analysis phase helps in identifying the limitations of existing online shopping systems and designing an improved solution using modern technologies such as Augmented Reality and cloud-based services.

3.1 FEASIBILITY STUDY

Feasibility study is an essential step in system analysis that evaluates whether the proposed system is practical, implementable, and beneficial. It helps in identifying potential challenges and ensures that the system can be developed within the available resources. The feasibility study provides confidence that the system will function effectively in real-world conditions and meet user expectations.

The feasibility of the proposed system is analyzed under three major aspects: technical feasibility, economic feasibility, and operational feasibility. Each of these aspects plays a crucial role in determining the success of the system.

Technical Feasibility

Technical feasibility refers to the ability to implement the system using available technologies and resources. The proposed system is developed using modern web technologies such as HTML5, CSS3, and JavaScript, which are widely supported across all platforms. These technologies ensure that the system can run efficiently on various devices without compatibility issues.

The backend is handled using Google Firebase, which provides real-time database services, authentication, and secure data management. This eliminates the need for traditional server setup and reduces complexity. The integration of AR.js allows augmented reality features to be implemented directly in the browser, making the system lightweight and accessible.

The system does not require high-end hardware, as it can function on standard devices with basic configurations. Therefore, the project is technically feasible and suitable for real-world implementation.

Economic Feasibility

Economic feasibility evaluates the cost-effectiveness of the proposed system. The project is designed using open-source technologies and free-tier services, which significantly reduces development costs. There is no need for expensive software licenses or dedicated server infrastructure.

Firebase provides a free plan that supports authentication and database operations, making it ideal for small-scale and academic projects. The only investment required is time and effort for development. This makes the system highly economical and affordable.

In addition, the system has the potential to reduce product return rates in real-world applications, which can save costs for businesses. Therefore, the project is economically beneficial.

Operational Feasibility

Operational feasibility focuses on how well the system can be used by end users. The proposed system is designed with a simple and user-friendly interface, making it easy for users to interact with the platform.

Users can browse products, use the AR feature, and complete purchases without requiring technical knowledge. The system supports multiple devices such as smartphones, tablets, and desktops, ensuring accessibility for a wide range of users.

The AR feature works using the device camera, allowing users to visualize products in their environment. This enhances usability and improves user experience. Hence, the system is operationally feasible.

3.2 EXISTING SYSTEM

The existing system of online furniture shopping is primarily based on traditional e-commerce platforms that rely on static images and textual descriptions. These platforms allow users to browse products and make purchases, but they lack advanced visualization capabilities.

One of the major limitations of the existing system is the inability to visualize how a product will appear in a real environment. Customers are required to imagine how furniture will fit into their space, which often leads to confusion and uncertainty. This results in poor decision-making and dissatisfaction after purchase.

Another issue is the lack of interactivity. Users can only view images and read descriptions, which does not provide a complete understanding of the product. This reduces user engagement and makes the shopping experience less effective.

The existing system also contributes to high product return rates. Since customers cannot accurately judge product size and design compatibility, they may return items after delivery. This creates additional costs for both customers and businesses.

In addition, many platforms do not focus on user experience and design quality. The absence of a premium interface reduces the overall attractiveness of the platform and affects customer satisfaction.

Limitations of Existing System

1. No real-time product visualization
2. High dependency on user imagination
3. Limited user interaction
4. Increased product return rates
5. Lack of immersive experience

Existing System Analysis Table

Feature	Description	Limitation
Product Display	Static images	No real visualization
Interaction	Basic browsing	No advanced features
User Experience	Standard design	Not engaging
Decision Making	Based on guess	Not accurate

3.3 PROPOSED SYSTEM

The proposed system introduces an advanced solution to overcome the limitations of traditional e-commerce platforms. It is designed as an Augmented Reality based virtual try-on e-commerce platform that allows users to visualize products in their real environment using a device camera.

This system enhances the online shopping experience by providing an interactive and realistic way to explore products. Users can place virtual furniture in their space and understand how it fits in terms of size, design, and placement. This reduces uncertainty and improves confidence in purchasing decisions.

The platform includes all essential e-commerce functionalities such as user registration, product browsing, shopping cart management, and order processing. The integration of Firebase ensures secure data storage, real-time updates, and efficient system performance.
The user interface is designed with a modern and luxurious appearance, making the platform visually appealing. The responsive design ensures that the system works smoothly across different devices.

Key Features of Proposed System

1. Augmented Reality based product visualization
2. Dynamic product catalog
3. Real-time shopping cart system
4. Secure user authentication
5. Responsive and modern UI

Advantages of Proposed System

The proposed system provides several improvements over the existing system. It allows users to interact with products in a realistic manner, improving user engagement. The AR feature helps in reducing product return rates and enhances customer satisfaction.
The system also provides faster performance and better scalability due to the use of modern technologies. It creates a more efficient and user-friendly shopping environment.

Proposed System Table

Feature	Description
AR Visualization	Real-time product placement
Cart System	Dynamic updates
Authentication	Secure login
UI Design	Premium and responsive

Comparison Table

Aspect	Existing System	Proposed System
Visualization	Static	AR-based
Interaction	Limited	Interactive
User Experience	Basic	Advanced
Technology	Traditional	Modern

CHAPTER 4

SYSTEM DESIGN

SYSTEM DESIGN

System design is the process of defining the architecture, components, modules, and data of a system to satisfy specified requirements. It acts as a blueprint for the implementation phase. The system design of the proposed platform focuses on creating a structured, scalable, and efficient solution that integrates Augmented Reality with e-commerce functionalities.

The design phase ensures that all system components work together effectively while maintaining performance, security, and usability. It includes database design, input/output design, and data flow representation.

4.1 NORMALIZATION

Normalization is the process of organizing data in a database to reduce redundancy and improve data integrity. It ensures that the database is efficient and eliminates unnecessary duplication of data.

The proposed system uses a structured data model in Firebase Firestore, where data is stored in collections and documents. Although Firestore is a NoSQL database, normalization concepts are applied to maintain data consistency.

Objectives of Normalization

1. To eliminate data redundancy
2. To ensure data consistency
3. To improve data integrity
4. To simplify data management

Normalization Levels

First Normal Form (1NF):

Ensures that all fields contain atomic values and there are no repeating groups.

Second Normal Form (2NF):

Ensures that all non-key attributes depend on the primary key.

Third Normal Form (3NF):

Removes transitive dependency and ensures that non-key attributes depend only on the primary key.

Example Table Before Normalization

Order ID	Name	Product 1	Product 2	Product 3
101	John	Chair	Table	Sofa

After Normalization

Customers Table

Customer ID	Name
C101	John

Orders Table

Order ID	Customer ID
101	C101

Order Items Table

Order ID	Product
101	Chair
101	Table
101	Sofa

Normalization improves performance and ensures efficient data storage.

4.2 TABLE DESIGN / DATA DICTIONARY

The system uses Firebase Firestore database, which stores data in collections. The following tables represent structured data organization.

Users Table

Field Name	Data Type	Description
Uid	String	Unique user ID
Name	String	Full name
email	String	Email address
Created At	Timestamp	Account creation time

Products Table

Field Name	Data Type	Description
Product Id	String	Unique product ID
name	String	Product name
category	String	Product category
price	Number	Product price
image	String	Product image path

Cart Table

Field Name	Data Type	Description
Cart Id	String	Cart ID
User Id	String	User reference
quantity	Number	Quantity of product

Orders Table

Field Name	Data Type	Description
Order Id	String	Unique order ID
User Id	String	User reference
total	Number	Total price
status	String	Order status
Created At	Timestamp	Order date

Messages Table

Field Name	Data Type	Description
Message Id	String	Unique ID
name	String	User name
email	String	Email
message	String	Message content

4.3 INPUT DESIGN

Input design focuses on capturing user data accurately and efficiently. It ensures that the data entered is valid and meaningful. The system includes multiple input forms such as login, registration, contact form, and order form.

Input Forms Table

Form Name	Fields	Validation
Login	Email, Password	Required fields
Register	Name, Email, Password	Min 6 characters
Contact	Name, Email, Password	Required
Checkout	Address, Phone	Required

4.4 DATA FLOW DIAGRAM (DFD) & CFD

Data Flow Diagram represents how data moves through the system. It shows inputs, processes, and outputs.

DFD Level 0 (Context Diagram)

The system is represented as a single process interacting with:

1. User
2. Firebase Database
3. Camera

DFD Level 1 Explanation

The system is divided into major processes:

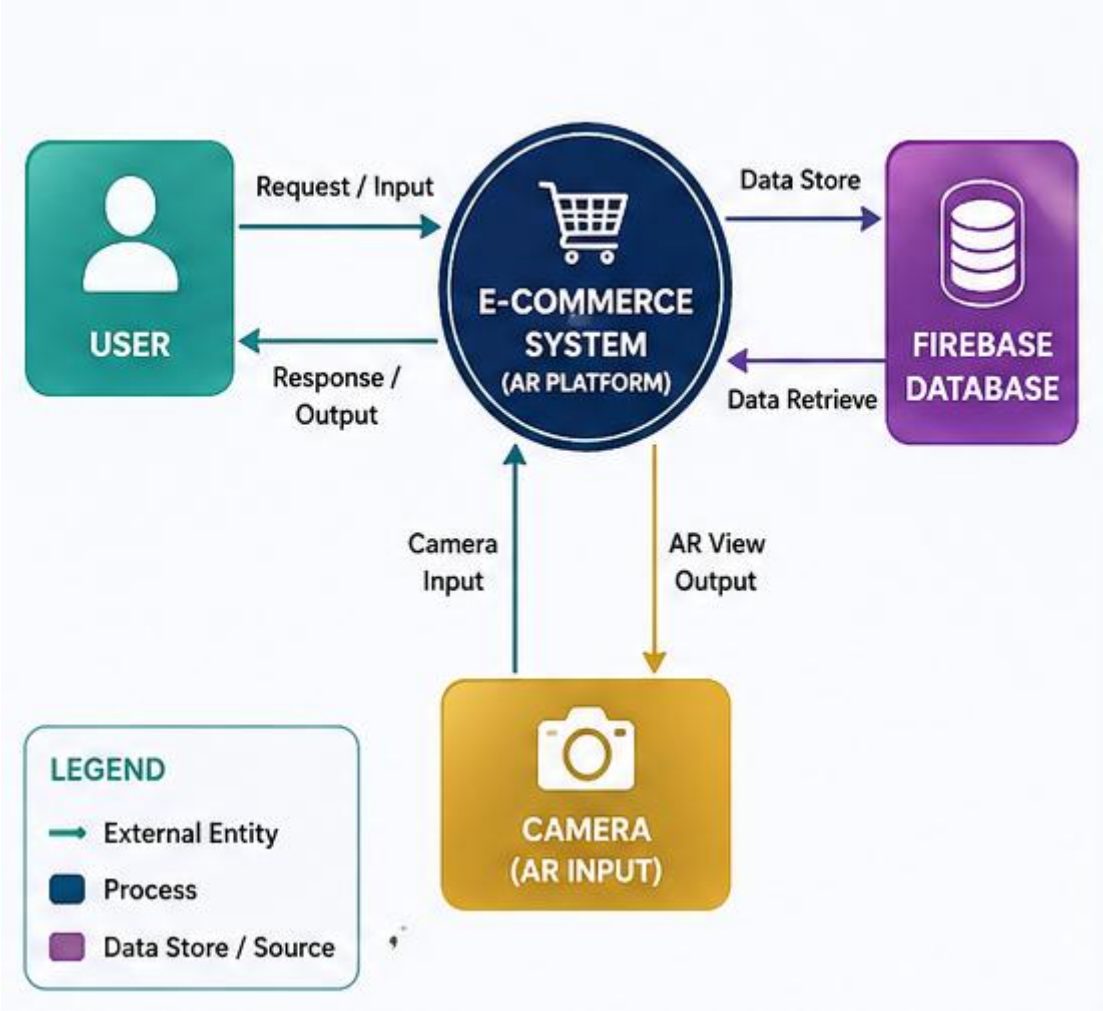
1. User Authentication
2. Product Browsing
3. AR Visualization
4. Cart Management
5. Order Processing

Each process interacts with the database to store and retrieve data.

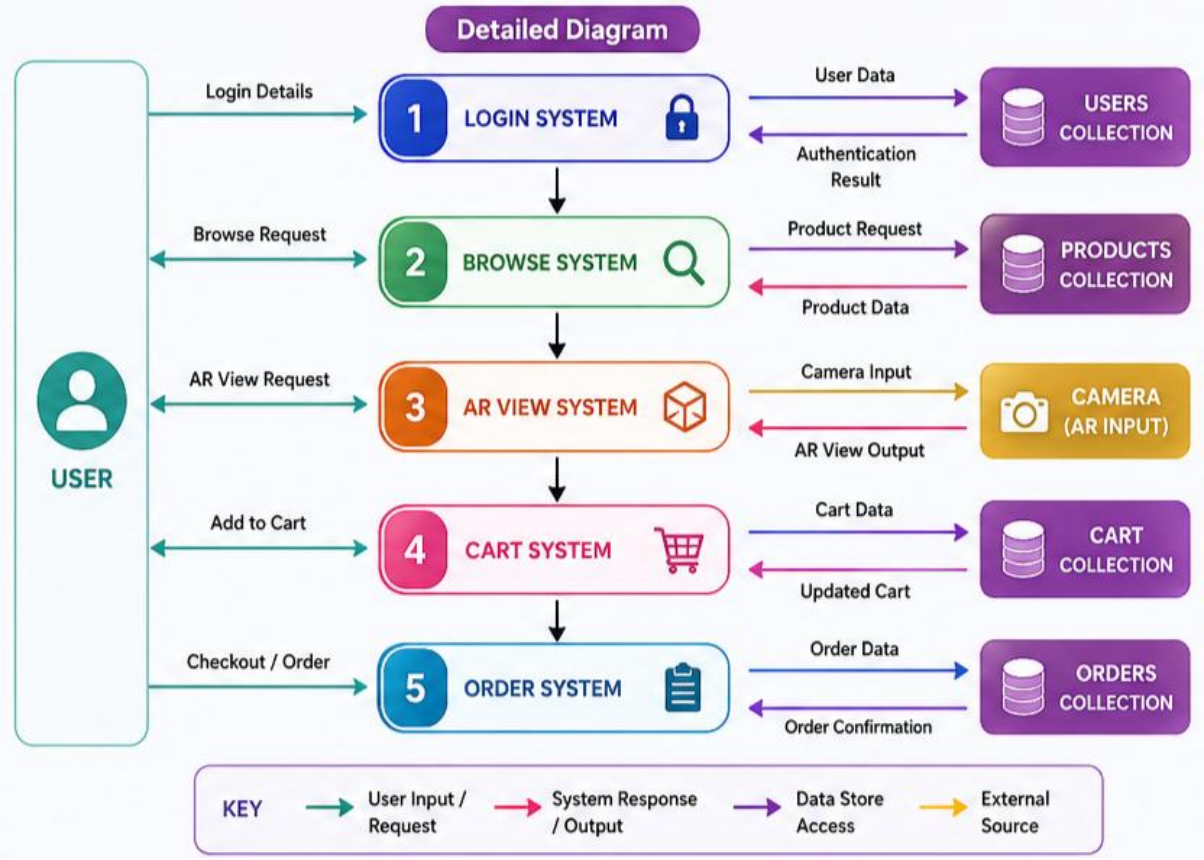
Data Flow Table

Process	Input	Output
Login	Email, Password	User dashboard
Browse	Product request	Product list
Cart	Add item	Updated cart
Order	Checkout data	Order confirmation

DFD LEVEL 0 (Context Diagram)



DFD LEVEL 1 (Detailed Diagram)



CHAPTER 5

SYSTEM DESCRIPTION

Introduction to the System

The system description provides a comprehensive understanding of the design, structure, and working of the proposed Augmented Reality based virtual try-on e-commerce platform. The primary objective of this system is to enhance the online shopping experience by integrating advanced visualization techniques with modern web technologies. The system is developed to overcome the limitations of traditional e-commerce platforms, particularly in the domain of furniture shopping where physical visualization plays a critical role in decision-making.

The platform, developed under the brand En'Decore, focuses on delivering a premium and interactive user experience. It allows customers to explore products, visualize them in real-world environments using augmented reality, and complete purchases through a seamless and secure process. The system is designed to be scalable, efficient, and accessible across multiple devices, making it suitable for a wide range of users.

Overall System Architecture

The overall structure of the system is based on a web-based client-cloud model, where the frontend handles user interaction and the backend services are managed through cloud infrastructure. The frontend is developed using HTML5, CSS3, and JavaScript, which together provide a lightweight and responsive interface. The backend is powered by Firebase, which offers authentication services and real-time database capabilities.

The system operates by processing user inputs through the browser and communicating with Firebase services to store and retrieve data. The augmented reality functionality is integrated directly into the frontend using AR.js, enabling real-time rendering of virtual objects without requiring additional installations. This architecture ensures high performance, scalability, and ease of maintenance.

Home Page Module

The home page serves as the entry point of the system and plays a crucial role in attracting users and providing an overview of the platform. It is designed with a premium aesthetic that reflects the brand identity of En'Decore. The layout includes visually appealing sections such as banners, featured products, and navigation menus that guide users through the platform.

The home page is optimized for responsiveness, ensuring that it adapts seamlessly to different screen sizes. It provides quick access to product categories and highlights important features of the platform. The design emphasizes simplicity and elegance, making it easy for users to navigate and interact with the system.

Product Catalog Module

The product catalog module is responsible for displaying the available products in an organized and dynamic manner. The system retrieves product data from the database and renders it using JavaScript, ensuring that the content is updated in real time. Products are categorized into different sections such as armchairs, sofas, and tables, allowing users to browse efficiently.

The catalog supports filtering and sorting functionalities, enabling users to customize their browsing experience. The dynamic nature of this module improves performance and reduces loading time. It also enhances user engagement by providing a smooth and interactive browsing experience.

Product Detail Module

The product detail module provides in-depth information about a selected product. When a user selects a product from the catalog, they are directed to a dedicated page that displays detailed descriptions, images, and pricing information. This module plays a vital role in influencing purchasing decisions by providing comprehensive product insights.

One of the key features of this module is the integration of augmented reality. Users can activate the AR feature to visualize the product in their real environment. This functionality allows users to assess the size, design, and placement of the product, thereby reducing uncertainty and improving confidence in their decisions.

Augmented Reality (AR) Module

The augmented reality module is the core component of the system, providing an innovative way for users to interact with products. This module uses AR.js to render 3D models of furniture items within the user's physical environment through the device camera. The implementation is browser-based, eliminating the need for additional applications.

The AR module enhances user engagement by offering a realistic visualization experience. It allows users to position and view products from different angles, providing a clear understanding of how the product will appear in their space. This feature significantly improves the overall shopping experience and sets the system apart from traditional e-commerce platforms.

Shopping Cart Module

The shopping cart module manages the products selected by the user for purchase. It provides a dynamic interface where users can view, update, and remove items from their cart. The module calculates the total cost based on selected quantities and applies applicable taxes automatically.

The cart data is stored in Firebase Firestore, ensuring persistence and real-time synchronization. This allows users to access their cart from different devices without losing data. The module is designed to be efficient and user-friendly, providing a smooth transition from product selection to checkout.

User Account Module

The user account module handles authentication and profile management. It allows users to register, log in, and manage their personal information. Firebase Authentication is used to ensure secure handling of user credentials.

Once logged in, users can access their account details, view order history, and manage their cart. The module is designed to provide a personalized experience, enhancing user engagement and trust. Security measures are implemented to protect user data and prevent unauthorized access.

Order Processing Module

The order processing module is responsible for handling the final stage of the purchase process. It collects shipping details from the user and processes the order by storing relevant information in the database. The module ensures that all data is validated before completing the transaction. Once an order is placed, the system generates a confirmation and updates the database accordingly. This module ensures a smooth and reliable transaction process, contributing to user satisfaction and system efficiency.

Contact Module

The contact module enables communication between users and the platform. It allows users to submit queries, feedback, or support requests through a simple form. The submitted data is stored in the database for further processing.

This module plays an important role in improving customer support and maintaining user satisfaction. It provides a direct channel for users to interact with the platform and share their concerns.

System Performance and Optimization

The system is designed to deliver high performance and efficiency. The use of lightweight frontend technologies ensures fast loading times and smooth interaction. Techniques such as lazy loading and efficient data handling are implemented to optimize performance.

The system is tested across multiple devices and browsers to ensure compatibility and reliability. Performance optimization plays a crucial role in maintaining user engagement and ensuring a seamless experience.

Security and Data Protection

Security is a critical aspect of the system design. The platform uses Firebase Authentication to manage user identities securely. Firestore security rules are implemented to control access to data and prevent unauthorized actions.

Input validation is applied to all forms to ensure data accuracy and prevent malicious input. These measures ensure that the system maintains data integrity and protects user information.

Future Enhancements

The system is designed with flexibility to support future enhancements. Features such as payment gateway integration, AI-based recommendations, and advanced analytics can be added to improve functionality.

The modular design allows easy integration of new components without affecting existing features. This ensures that the system remains relevant and adaptable to future technological advancements.

Conclusion

The system description provides a detailed overview of the working and structure of the proposed platform. It highlights the integration of augmented reality with e-commerce functionalities to create an advanced shopping experience. The system successfully addresses the limitations of traditional platforms and provides a modern, efficient, and user-friendly solution.

CHAPTER 6

TESTING AND IMPLEMENTATION

Testing Strategy

Testing was carried out in multiple stages to ensure that the system works correctly, efficiently, and without errors. Different types of testing methods were applied to validate individual components as well as the complete system.

Unit Testing

Unit testing focuses on testing individual modules separately.

1. Product rendering functions were tested to ensure correct product card display.
2. Star rating function was verified for full, half, and empty stars.
3. Cart calculations were tested:
    - Subtotal calculation
    - GST (18%) computation
    - Final total calculation
4. Firebase authentication functions were validated:
    - User login
    - Registration
    - Error handling

Integration Testing

Integration testing ensures proper interaction between modules.

1. Product added to cart → verified in cart page.
2. User login → checked access to cart and order placement.
3. Contact form submission → verified in Firestore database.
4. Guest cart → successfully merged after user registration.

Functionality Testing

System functionalities were tested with expected outputs.

1. User registration with valid data → account created successfully.
2. Login with correct credentials → dashboard displayed.
3. Login with incorrect password → error notification shown.
4. Add product to cart → cart updates correctly.
5. Update quantity → totals updated properly.
6. Remove item → cart recalculates values.

7. GST calculation → 18% tax applied correctly.
8. Place order → order stored and cart cleared.
9. AR "View Piece" → camera opens with AR model.
10. Contact form → data saved in database.
11. Product filtering → correct category displayed.

Cross-Browser Testing

Application was tested across different browsers.

1. Google Chrome → fully compatible.
2. Microsoft Edge → fully compatible.
3. Mozilla Firefox → minor CSS differences.
4. Safari → compatible.

Performance Testing

Performance testing ensures system speed and efficiency.

1. Page load time maintained under 3 seconds.
2. Loader animation used for better user feedback.
3. Lazy loading applied for images.
4. Fallback images used for broken links.

Implementation

The system was implemented in multiple structured phases to ensure smooth development and integration.

Implementation Phases

1. Design System Setup
    - Created CSS variables
    - Defined color palette and typography
    - Built reusable UI components
2. Page Structure Development
    - Developed HTML pages
    - Added navigation and footer
    - Maintained semantic structure

3. Firebase Integration
    - Configured Firebase project
    - Implemented Authentication
    - Connected Firestore database
    - Created utility functions
4. Dynamic Features Implementation
    - Product rendering using JavaScript
    - Cart management system
    - User authentication flow
    - Event handling
5. AR Integration
    - Integrated AR.js library
    - Implemented camera-based visualization
    - Designed AR modal interface
6. Testing and Refinement
    - Conducted full system testing
    - Fixed bugs and errors
    - Improved UI/UX performance

CHAPTER 7

CONCLUSION AND FUTURE SCOPE

Conclusion

The development of the Augmented Reality based virtual try-on e-commerce platform represents a significant advancement in the field of online shopping systems. The project successfully integrates modern web technologies with immersive visualization techniques to create a platform that enhances user experience and improves decision-making. The system addresses the core limitations of traditional e-commerce platforms by enabling users to interact with products in a realistic and meaningful way.

The implementation of the system demonstrates the practical application of augmented reality in solving real-world problems associated with online furniture shopping. By allowing users to visualize products in their own environment, the system reduces uncertainty and builds confidence in purchasing decisions. This approach not only improves customer satisfaction but also contributes to reducing product return rates.

The project achieves several important objectives that contribute to its effectiveness and usability. These achievements can be summarized through the following key aspects.

1. The system successfully integrates augmented reality technology into a web-based e-commerce platform, providing a unique and interactive shopping experience that differentiates it from conventional systems.
2. The platform is designed using lightweight and efficient technologies such as HTML5, CSS3, and JavaScript, ensuring fast performance and compatibility across different devices and browsers.
3. The use of Firebase as a backend service simplifies data management and provides real-time synchronization, secure authentication, and reliable storage of user and transaction data.
4. The user interface is designed with a premium and modern aesthetic, enhancing visual appeal and improving user engagement throughout the platform.
5. The implementation of a dynamic product catalog allows users to browse, filter, and sort products efficiently, improving the overall usability of the system.
6. The integration of the augmented reality feature enables users to visualize furniture in their real environment, which significantly enhances the decision-making process.
7. The shopping cart and order processing modules provide a seamless transaction experience, ensuring that users can complete purchases easily and efficiently.
8. The system ensures data security through proper authentication mechanisms and validation techniques, protecting user information and maintaining data integrity.

Future Scope

The proposed system provides a strong foundation for further development and enhancement. While the current implementation successfully achieves its objectives, there are several opportunities to expand the functionality and improve the system to meet future demands. The future scope of the project focuses on incorporating advanced technologies and additional features to enhance user experience and system performance.

The following areas represent potential directions for future development.

1. The system can be enhanced by integrating a real-time payment gateway that allows users to complete transactions securely using digital payment methods such as credit cards, debit cards, and online banking systems.
2. The implementation of artificial intelligence can enable personalized product recommendations based on user preferences, browsing history, and purchasing behavior, improving customer engagement and sales.
3. The augmented reality module can be further improved by introducing advanced 3D models with higher accuracy, realistic textures, and better interaction capabilities to provide an even more immersive experience.
4. The system can support customization features that allow users to modify product attributes such as color, size, and material within the AR environment before making a purchase.
5. The development of a dedicated mobile application can improve performance and provide additional features such as offline access and push notifications.
6. The system can be extended to support multiple languages, enabling it to reach a wider audience and improve accessibility for users from different regions.
7. The integration of cloud-based analytics tools can provide insights into user behavior, helping businesses make data-driven decisions and improve their marketing strategies.
8. The implementation of an administrative dashboard can allow system administrators to manage products, monitor orders, and analyze system performance effectively.
9. The system can incorporate real-time chat support or chatbot functionality to assist users in resolving queries and improving customer service.
10. The introduction of virtual room measurement tools can help users accurately determine whether a product fits within their available space.
11. The platform can be expanded to include additional product categories such as home decor, lighting, and accessories, increasing its market scope.

12. The integration of social media features can allow users to share their AR experiences and product selections, enhancing user engagement and promoting the platform.
13. The system can be optimized further for performance by implementing advanced caching techniques and improving data retrieval mechanisms.
14. The use of machine learning algorithms can enable predictive analysis, helping to identify trends and improve product recommendations.
15. The security features of the system can be enhanced by implementing advanced encryption techniques and multi-factor authentication to provide additional protection for user data.
16. The system can support collaborative features that allow multiple users to view and interact with the same AR environment, enabling shared decision-making.
17. The implementation of voice-based interaction can provide a more convenient way for users to navigate the platform and access features.
18. The platform can be integrated with Internet of Things (IoT) devices to create a smart home ecosystem where furniture and appliances can interact with each other.
19. The system can include a review and rating mechanism that allows users to share feedback and help others make informed decisions.
20. The platform can be deployed on a larger scale with cloud hosting solutions to support a growing number of users and ensure high availability.

The future scope of this project highlights the vast potential for growth and innovation in the field of augmented reality and e-commerce. By continuously improving and expanding the system, it is possible to create a highly advanced and intelligent platform that meets the evolving needs of users and businesses.

Overall Impact and Significance of the System

The development of the Augmented Reality based virtual try-on e-commerce platform represents a significant advancement in modern digital commerce. The system enhances online shopping by introducing interactive visualization, effectively bridging the gap between physical and digital experiences.

1. General Impact of the System

1. The platform improves traditional e-commerce by integrating AR technology.
2. It creates a connection between real-world environments and digital products.
3. The system introduces a new method of user-product interaction.
4. It addresses the major limitation of online shopping — lack of visualization.

2. Impact on User Experience

From the user's perspective, the system greatly enhances usability and satisfaction.

1. Provides realistic product visualization in the user's environment.
2. Reduces uncertainty before purchasing decisions.
3. Increases user confidence while selecting products.
4. Creates an interactive and engaging shopping experience.
5. Offers better understanding compared to traditional 2D product views.

3. Business Value and Benefits

From a business point of view, the system contributes to growth and efficiency.

1. Reduces product return rates, lowering operational costs.
2. Improves customer retention and repeat purchases.
3. Enhances overall customer satisfaction.
4. Strengthens brand identity through premium design.
5. Provides a competitive advantage in the market.

4. Technological Significance

The system demonstrates the effective use of modern technologies.

1. Implements augmented reality in a real-world application.
2. Utilizes cloud-based services like Firebase.
3. Applies modern web development techniques.
4. Integrates multiple technologies into a single platform.

5. Academic and Learning Contribution

The project provides valuable academic and practical knowledge.

1. Enhances understanding of system design and architecture.
2. Provides experience in real-time data handling.
3. Demonstrates user authentication mechanisms.
4. Applies responsive design principles.
5. Introduces AR integration in web applications.

6. Relevance to Industry Trends

The system aligns with current technological advancements.

1. Supports digital transformation in e-commerce.
2. Focuses on user-centric and interactive design.
3. Meets demand for immersive applications.
4. Reflects modern development practices.
5. Adapts to changing user expectations.

7. Scope for Other Domains

The approach can be extended beyond furniture e-commerce.

1. Applicable in fashion (virtual try-on of clothes).
2. Useful in real estate (virtual property visualization).
3. Supports interior design planning.
4. Can be used in retail and product demos.
5. Enables better visualization-based decision making.

8. Overall Conclusion

1. The system effectively solves real-world shopping challenges.
2. It improves user experience through innovation.
3. Demonstrates the power of combining multiple technologies.
4. Encourages adoption of modern tools in development.
